

Acta CAT Solar español 2018B

Spanish Solar TAC 2018B

-At the meeting: Julian Blanco, Elena Khomenko, Judith Palacios, Rolf Schlichenmaier, Hector Socas-Navarro

16 days are available for the Spanish time during the GREGOR 2018B campaign. Four proposals have been received requesting a total of 31 days.

The Domínguez and Collados proposal requires 11 days for the installation and commissioning of the GRIS IFU. The TAC has been informed that there are 6 days of technical time still available in this period. We recommend that this proposal is split between those 6 days of technical time and the remaining 5 from Spanish time. Furthermore, the TAC requests the telescope management to consider allocating more days of technical time, thus freeing some or all of the 5 days of Spanish time from this proposal. In that case, the new available days would be distributed among the other proposals as detailed below.

We recommend allocating 5 days of observation to the Trelles Arjona et al proposal

The Rezaei et al and the Collados et al proposals request the same instrumental configuration and observing target (active regions). We recommend that these two proposals are combined and allocated 6 days.

If any additional days were available, we recommend adding the first day to the Trelles Arjona et al proposal and any subsequent days to the combined Rezaei et al+Collados et al proposals.

Finally, the TAC wishes to commend all of the authors for the high quality of the proposals received in this call
